

Easy Save User Guide V.1.0:

Easy Save is a new software developed in order to help you save your work by creating smart and simple backups. Backups are made with the different information you are asked to enter.

Here is how our software's interface looks like:

```
=====
                        Welcome in EasySave

[1] - Create a save
[2] - Execute a save
[3] - Show a save detail
[4] - Delete a save
[5] - Modify a save
[6] - Change language settings
[7] - Close the application

=====
Please, Enter a number corresponding to the menu: _
```

Fig. 1: Main menu of Easy Save:

Our software is a console application. It displays several choices you can choose from by typing a number in the console. When asked to, you might also type in letters.

Easy Save allows you to:

- **1: Create a save:** This option enables you to create a new backup. When chosen, the user must enter a name for the new backup, a source path, a destination path, and the type of the backup (complete, meaning it will copy all the elements or differential, as it will only copy the lines that are different).
- **2: Execute a save:** This option enables you to execute all the existing backups made with Easy Save. When chosen you can execute one save or all the save in sequential.
- **3: Show a save detail:** When chosen, this option lets you choose between opening a specific backup (by typing its name), this option displays a name, a source path, a destination path, and a type for each backup.
- **4: Delete a save:** This option allows you to delete an existing backup. When chosen, this option asks you to enter the backup's name. If it is found, the software deletes it. Otherwise, it will display an error message and the user must start over.
- **5: Modify a save:** This option allows you to modify an existing backup. When chosen, this option asks you to enter the backup's name you want to modify. When your backup is selected you can modify the name, the source path, the destination path, and the type of the backup. Otherwise, it will display an error message and the user must start over.
- **6: Change language setting:** This option enables you to change the language used in the different menus of the software. When chosen, this option lets you choose between the different languages available (English and French for the moment). If the input isn't one of the options available, the software displays an error message, and the user must start over. Otherwise, the change is effective, and the software displays the menu in the new language chosen.
- **7: Close the application:** When chosen, this option stops all the software's processes and then asks the user for a random input in order to close all the software's windows.
